

**The Davistown Museum would like to announce the publication of *Where Have All the Plastics Gone? Ménage à Trois in the Sea Surface Microlayer: Nanoparticles as Vectors of Environmental Chemicals.***

I would like to ask the press to provide more detailed coverage on the presence and significance of plastic nanoparticles (PNP) in the environment than has thus far been reported in media such as the New York Times, the Public Broadcasting Network, Pro Publica, and the TV news media, etc. The enclosed public safety notice which accompanies this publication provides a synopsis of the reasons why we have issued a hazardous material alert about the devolution of microplastic debris into plastic nanoparticles. Plastic nanoparticles become efficient carriers of environmental carriers in all trophic levels of the biosphere. Please contact me with questions you may have about these and other museum publications.
